D-DRUM	**TRAFFIX DRUM DEL W/TIRE RING**

Channelizing devices, better known as cones, delineators and drums are typically used to redirect traffic around temporary work zones.

Tech notes:

- By CA MUTCD standards, cones shall be reflectorized, and should not be left in use during non-work hours.
- Cones offer greater "visible area" than delineators and are easier to set, store and transport than delineators or drums.
- Delineators are a better choice for use when the traffic control is in place during non work hours.
- JBC's cones are precision molded with no annoying tendency to stick together like some other manufacturers offerings.
- JBC's cones are much more robust than other manufacturers feeble, flow-molded "drippy" cones.
- In addition to orange, JBC also offers cones in lime, red, white, blue and pink. Not all colors are available in all sizes though.
