Locations: San Francisco, Fairfax, Fair Oaks, and Truckee

775-846-9000

Disclaimer

Please be aware that your Thermography Exam is not a replacement for your regular Mammograms, and not a replacement for your Doctors Recommendations for other testing that may be necessary. Thermal Imaging is an Adjunctive Breast Health Awareness tool to understand your Breast Physiology and not an anatomic diagnostic tool. Thermography is not a Cancer Diagnostic Tool. The only Cancer diagnostic test for the Breast is the Biopsy. The Breast Health Screening tools are to help you gain more information about your Breast Health, but do not necessarily indicate if you have or do not have cancer.

Thermography is a tool to that is best used when comparing over time. If there are hot spots in the breast it can indicate a higher risk for cancer, or it can indicate that you have inflammation, an infection, an injury, or a hormonal imbalance. When comparing your exams over time, you can track changes with your breast health.

The lack of heat in the breast does not necessarily mean that you do not have cancer.

When you combine Thermography with other Breast Health Screening tools, you may have more information that your doctor can use in order to help you with a Breast Health Tracking Program which may also include yearly Mammograms, Physical Exams, Blood Tests, MRI, Ultrasound, Etc.

Please always follow your Doctor's recommendations about what screening tools will help you in tracking your breast health.
