Appropriate Building Solutions for Haiti

Senp Kay – Simple House

Port-au-Prince, Haiti - February 2012

The **Senp Kay** introduced by Andy Mueller of GreenSpace Collaborative is the first structure in Haiti constructed utilizing prefabricated, tilt-up, plastic bottle filled panels and light straw-clay walls. It was designed and constructed as an innovative solution for low-tech, sustainable housing for low income communities in emergent nations.

Affordable housing is an issue of huge social relevance in Haiti, and indeed globally. Two years have passed since the earthquake in 2010 and thousands of Haitians continue to be without permanent shelter. There are over 800 camp settlements with an estimated .5 million people still homeless. Inadequate standards of construction and poor quality materials were the root causes of many of the collapsed buildings and loss of life. It is extremely important that reconstruction addresses these issues, and ensures that new buildings are earthquake resistant and provide protection in the face of future seismic events as well as hurricanes. The need for permanent, affordable, safe housing is pressing.

There is an abundance of precedents and inspiration using plastic bottles, tilt-up panels and straw-clay infill as wall systems; The World Earthship Biotope movement utilizes plastic bottles as non-structural filler in walls. The Tilt-up method of wall construction (typically concrete) has been practiced since the early 1900's, and variations of the straw-clay walls have been utilized for over 700 years in many parts of the world. All three methods have successfully evolved independently in their respective applications, and here they are joined as a hybrid solution for the conditions in Haiti.

The **Senp Kay** uses a modular wall design which incorporates the structural integrity of the Tilt-up panel, the creative repurposing of the bottle wall system and the simplicity of light straw-clay infill. It is simple to mass produce on site, assemble and customize to one's particular needs. The use of repurposed

materials is a positive response to one of many environmental problems in Port-au-Prince. Haiti currently has no successfully operational recycling facilities and there are many refuse dumps where piles of waste lie as a potential source for innovative construction material use. Rice straw is plentiful in both the Artibonite and Les Cayes valleys. Straw is a rapidly renewable resource and 80% of the rice straw goes to waste, usually burned after harvest adding to Haiti's already serious air pollution problem.

The **Senp Kay** explores the use of local and repurposed materials as a substitute to the widely accepted concrete block method of construction. It offers unprecedented, appropriate solutions to long-standing problems associated with the building of shelter in Haiti. Solutions that are not merely handed to the local population, but owned and built by them. This will take more than a single demonstration project, but the idea is to captivate the imagination of the Haitians who have contributed to the project and of those who follow.

Project Features

REPURPOSED LOCAL MATERIALS: The prototype utilizes many in-country materials; ubiquitous plastic bottles, plastic bags, crushed rubble, clay soil, bamboo, sand and rice straw.

FLEXIBLE DESIGN: Prefabricated panels allow for expansion in either two or four foot increments. Each wall can contain up to one-third door or window openings. Shed, gable, or hipped roofs can be used. In addition, the shed roof can extend from the rear of the house to accommodate an outdoor kitchen and a semi-enclosed shower with access to the habitable space.

EARTHQUAKE AND HURRICANE RESISTANT: The construction of this prototype demonstrates these wall systems have excellent resistance to earthquake and hurricane forces, both in-plane and out-of-plane. It utilizes a light and resilient structural system compared to the heavy and brittle concrete and block systems typically employed in Haiti. They can be part of a well-engineered structure capable of withstanding forces of a 7.0 or greater earthquake and 140 mph hurricane winds.

COMFORT: Solutions include building orientation, window/door location, shading, wall and ceiling insulation, and generous ventilation.

LOW COST: The Senp Kay is more sustainable and less carbon consumptive than the typical concrete block building in Haiti. Cost per square foot-\$35USD. In this project, the main goals were to reduce the time and cost of the building process, and to allow community involvement.

FAST CONSTRUCTION: low-tech, easy to assemble structure, requiring only two skilled trades. The structural system is produced locally, is suited for mass production and provides job opportunities and skills development for the community.

EFFICIENT USE OF WOOD: Haiti urgently needs a long-term plan for reforestation and sustainably harvested lumber. The Senp Kay currently utilizes imported wood for its light weight wall and roof frame; however, it uses this wood very efficiently compared to other wood frame systems. It is expected that in-county wood could be utilized in the future.

SIMPLE, HONEST, AND ECONOMICAL

Materials

- #179, 20 oz. plastic bottles per 4'x8' prefabricated panel
 - 20 gauge x 1" galvanized mesh
 - Internal Bamboo reinforcement in the straw-clay infill walls
 - Clay, Soil-cement and Cement plaster
 - Repurposed gutter rain catchment system
 - Roof and wall tie-downs to resist earthquake and hurricane forces
- Straw-clay wall infill
 - 2x4 and 1x4 lumber
 - Corrugated steel roofing
 - Concrete footing and stem wall

Contributors

Donations

Please consider donations to support the next phases of this important work that will create local industries and employment, provide an inspired model of sustainable reconstruction, and that is expected in time to sustain itself. All donations are tax deductible as Builders Without Borders is a project of Networks Productions, a registered 501(c)3 non-profit organization.

To donate see BWB's website at www.builderswithoutborders.org and click on the Donate tab. Please specify "Contribution for Semp Kay"
