

Gail's training as a veterinary technician and health professional gives her unique insights which she pursues through applied, integrative research and "outside the box" thinking.

In addition to her accomplishments in hand-rearing techniques, she has a wide network of global collaborators and colleagues with whom she interacts and seeks expertise to properly investigate scientific queries of interest.

Two areas in which I've had the pleasure of collaborating with Gail include topics for which there is relatively little data (to date) in applied zoo feeding programs: fatty acid and amino acid (specifically, taurine) investigations.

Her tenacity for seeing projects through to completion, and sharing that information through scientific publication is to be admired."
