

imagepac stampmaker

USING THE SMALL STAMP BORDER... Step by Step...

1 Turn on the Stampmaker and lay your small stamp border into the recessed area of the clamp with the white side facing up.

2 Place the negative on top of the stamp border making sure you lay it 'ink' side up. If making a text stamp, writing readable.

3 Place the imagepac on top of the negative so the 'imagepac' writing is readable. The border helps prevent the edge of your small stamp from hardening.

4 Put the lid of the clamp on top, flip the clamp over and check you have centered your artwork.

5 Now return to step 4 of: **MAKING A STAMP Step by Step**, to continue making your stamp.

The finished stamp should have a clean base. Or, if you have flashed the stamp for 3 seconds, a very thin layer of polymer covering the base and a lovely deep relief. This will give you perfect stamping. We recommend using water based inks.

Hints & Tips when using Stampmaker

If your stamp is solid or has very little relief it is due to one of two things:

- 1) Your negative is not dark enough and letting too much light onto your pac. You will need to adjust your printer settings. Please refer to the instructions on changing printer settings or view the instruction video on the web site
- 2) You have exposed your stamp for longer than 3 seconds (step 5 of the instructions.) Please read the instructions from step 5 onwards and check your timings.

If your stamp prints with your writing in reverse you have either:

- 1) inserted the pac upside down which means the 'imagepac' writing would be readable (step 1 of the instructions)
- 2) placed your negative into your magnetic clamp so the 'inked' side was facing up (step 2 of the instructions)
- 3) Printed your negative with the writing in reverse (see separate printing instructions)

If the detail of your stamp washes away during the 'washout' process you may need to 'flash' the back of the stamp for 3 seconds (step 5 of the instructions)

If your stamp has lots of polymer and very little detail you may not have warmed the lamps for 1 minute before use (step 1 of the instructions)
