Facts about Laminaria Tents

Laminaria Tents from Norscan Medical, LLC are manufactured from carefully selected Laminaria Hyperborea, which is a plant from the clean waters of the North Sea.

By using Laminaria Tents, the dilation of the cervix can be obtained painlessly and with no danger of injuring the uterus.

There is no risk of uterine perforation or cervical laceration. Laminaria Tents should be considered wherever cervical dilation (or softening) of the cervix is desired. Some examples are:

1. Cervical stenosis related to dysmenorrhea, possible cause of infertility resulting from cauterization or conization.
3. Radium placement.
4. Drainage of uterine cavity.
5. Abrasio uteri.

Laminaria Tents are capable of absorbing fluids from the uterine cervix. The tent swells gradually, up to four times its diameter and makes an indulgent and symmetrical dilation of the cervical canal. Laminaria Tents diameter swell within the first 6 hours after insertion and may continue to grow for up to 24 hours.

Throughout the world, leading physicians and gynecologists have appreciated Laminaria Tents for more than a century, in cases where dilation of the cervix is indicated and are often to be preferred to Hegar’s dilators. The use of Hanka or Hegar’s dilators is attended with the risk of uterine perforation and cervical laceration.

The gradual swelling of the Laminaria has been found far less traumatic than rapid dilation methods, causing it to be the preferred choice of doctors. The swelling is quick and reliable.
